A constant mesh transmission is the type of manual transmission in which sliding gears from the sliding mesh transmission is replaced with the constantly meshed pairs of gears and the new shifting devices named dog clutches are introduced which helps in transmitting the required output to the main shaft by making contact with the appropriate pair of the meshed gears.

How Constant Mesh Gearbox Works? - Mechanical Booster

In a modern 'constant-mesh' manual transmission, the gear teeth are permanently in contact with each other, and dog clutches (sometimes called dog teeth) are used to select the gear ratio for the transmission. When the dog clutches for all gears are disengaged (i.e. when the transmission is in neutral), all of the gears are able to spin freely around the output shaft.

The most popular design is the constant-mesh gearbox. It has three shafts: the input shaft, the layshaft and the mainshaft, which run in bearings in the gearbox casing. There is also a shaft on which the reverse-gear idler pinion rotates. The engine drives the input shaft, which drives the layshaft.

There is a lack of a mechanism in constant mesh gearbox that can bring all the rotating shafts that are clutch shaft, main shaft and lay shaft at the same rotating speed, which is responsible for the harsh shifting. The teethes of the dog clutches shows wear and tear which in turn increases the maintenance of the system.
