For this guide, I suggest a conservative undervolt of -80mv for your CPU Core. Once that is done, click "CPU Cache" and perform the same steps. CPU Core and CPU Cache should generally have the same undervolt. It used to be suggested to run a modest -50mv undervolt on the iGPU, but there's some consternation about this at the moment.

The ThrottleStop Guide (2020): How to Lower Temperatures ...

V7 was designed to utilize multiple CPU cores with a multi-cored CPU slot (formerly SMP slot) and a GPU slot for each supported GPU. This configuration uses a lot more resources compared to using just a single CPU core.
