Abstract: The design of splined joints used in industrial applications frequently re-sults in maximum flank pressure. This often leads to overdimensioning and in cer-tain cases to failure of the shaft-hub connection. The existing german standard DIN 5466 for the calculation of load capacity, when coupled with increasing power den-

With a gear-shaped profile on one end, these shafts transmit high rotational loads— good for hydraulic systems, machine tools, and other high-torque applications. Compared to keyed shafts, they last longer, handle higher torque, and do not require as tight of a fit. Shafts are 1045 carbon steel, a general purpose shafting material that balances high strength and good machinability.
