Dynamic Analysis Cantilever Beam Matlab

This example shows how to include damping in the transient analysis of a simple cantilever beam. The damping model is basic viscous damping distributed uniformly through the volume of the beam. The beam is deformed by applying an external load at the tip of the beam and then released at time $t = 0$.

22. Mathematical analysis. For a cantilever beam exposed to free vibration, and the system is considered as continuous system considering the beam mass as distributed along with the stiffness of the shaft, the equation of motion can be written as given by the following equations (Meirovitch, 1967),

We will investigate beam dynamics and show the additional steps in the numerical solution of a time dependent problem. There are many time dependent problems discussed in Chapter #16. §16.1 – 1 DOF spring mass system. §16.2, 16.4 & 16.5 – bar element dynamic response. § 16.7 – truss and plane frame analysis.

beam according to the boundary conditions and applied loads. I have implemented a Matlab code to solve a cantilever beam or a simply supported beam with point loads at any location of the beam. There may even be supports at any location other than cantilever that is fixed at right hand side for the cantilever beam.

The predicted results of the new model, the basic valve theory model and the cantilever beam model are compared with the experimental results. The analysis of error band and root mean square error shows that the calculation results of the new model can more accurately reveal the motion law of reed valve than that of other two models.
