Sensors and Actuators Introduction to sensors

Sensors are how a product senses anything in the real-world, and there is an almost endless array of them available. Sensors measure real-world quantities, which are then converted into an electrical signal. Actuators, on the other hand, take an electrical signal and convert it into a physical form.

For example, a device that converts electrical energy into mechanical energy, such as by piezoelectricity (which may be considered a sensor by definition), is more generally termed an output transducer or an actuator rather than a sensor.

CHAPTER 1: INTRODUCTION TO SENSORS | Expanding the Vision ...

Actuators are devices that work opposite to sensors. A sensor converts a physical event into an electrical signal, whereas an actuator converts electrical signal into a physical event. When sensors are used at input of a system, actuators are used to perform output function in a system as they control an external device.

Introduction to sensor measurements, sensor characteristics and parameters. If we regard the sensor as an input-output system, the stimulus (input) is a measured variable, a physical or chemical quantity (in most of the cases non-electrical). In most of the cases the signal (output) is an electrical quantity (voltage). The purpose of a sensor is to respond with an electrical signal to an input ...

We use our hands, feet and voice to manipulate the world ... these are our actuators. Sensors are input devices which gather information and actuators are output devices which manipulate (act on) things. We have surrounded ourselves with machines and devices that do the same thing.

Introduction to sensors and actuators - Welcome to MATC

The approach adopted here is to view all devices as belonging to three categories: sensors, actuators, and processors (interfaces). Sensors are the devices that provide input to systems and actuators are those devices that serve as outputs. In between, linking, interfacing, processing, and driving are the processors.
