Of the various types of logs, the ones used most frequently in hydrocarbon exploration are called open-hole logs. The name open hole is applied because these logs are recorded in the uncased portion of the wellbore. All the different types of logs and their curves discussed in this text are of this type.

TYPES OF LOGS Logs run on wireline into a hole which has just been drilled, and before it is cased, are called open-hole logs. Logs run after the well is cased are called cased-hole logs. Open hole logs are mainly used to determine the petrophysical properties of the rocks.

Petrophysical analysis using these cased hole measurements proceed along the same lines as with the equivalent open hole logs, with only minor exceptions. The first is that the annulus between the casing and formation must be well cemented, with good cement fill up. Most cased hle logs suffer from poor cement.
