Using the Graphical Method to Solve Linear Programs J. Reeb and S. Leavengood EM 8719-E October 1998 \$2.50 A key problem faced by managers is how to allocate scarce resources among activities or projects. Linear programming, or LP, is a method of allocating resources in an optimal way. It is one of the most widely used operations research (OR) tools.

Operations Research: Using the Graphical Method to Solve Linear Programs. James E. Reeb. Scott Leavengood. Explains how linear programming (an operations research method for optimizing the allocation of resources) is a useful tool for managers planning single or multiple manufacturing facilities. Includes step-by-step instructions on: (1) how to translate a real-world problem into the linear programming equations necessary to create a valid model and (2) how to use the model to determine the ...

The method we will employ is known as the graphical method and can be applied to any problem with two decision variables. It basically consists of two steps: Finding the feasible region or the feasible space (which is the region in the plane where all the feasible solutions to the problems lie) and then identifying the optimal solution among all the feasible ones.
