The sandwich or squeeze method is something you can try when you can't solve a limit problem with algebra. The basic idea is to find one function that's always greater than the limit function (at least near the arrow-number) and another function that's always less than the limit function.

Calculus - dummies

Calculus by Spivak is one of my favorite math books of all time, and certainly the best covering proof-based calculus (or single-variable real analysis, if you will) that I ever encountered. That also seems to be the consensus among mathematicians I interact with.

Calculus: AOPS' vs Spivak's : mathbooks

Ever read a story where the ending is told at the beginning, and the beginning is told at the end? That's what happens in this story of the Twenty Dollar Bet. Jimmy Horton is just another, smart, high school student who tries to get along with everyone. He's well-liked and will take time to help anyone with a math problem. But he never expected his life to take the turn it did

Joseph Caruso (Author of Top Shelf Calculus)

We have now seen some of the most generally useful methods for discovering antiderivatives, and there are others. Unfortunately, some functions have no simple antiderivatives; in such cases if the value of a definite integral is needed it will have to be approximated.

10.5 Numerical Integration

Calculus Q&A Library A 15-foot teddy bear is leaning against a shelf. The top hand of the teddy bear is sliding down the shelf at a rate of 4 feet per second. How fast is the bottom of the teddy bear moving along the ground at the point in time when the bottom of the teddy bear is 2-foot from the shelf?

Answered: A 15-foot teddy bear is leaning against... | bartleby

I taught 11th grade math and physics in Tanzania for three months after being honorably discharged. After returning I took a job teaching at a local high school where I taught Algebra II, AP Calculus and AP Statistics. I went on to LSU where I taught college algebra, the calculus sequence, and differential equations while obtaining my PhD.

Joe G. - Physics, Calculus, and Geometry Tutor in ...

alright so the problem is $y = \tan x$ $dx/dt = 2$ $x = -\pi/3$ pretty simple I know and the answer is simply $dy/dt = (1/\sec^2 x) dx/dt$ however I would like to know how to prove this when converting $y = \tan x$ to $y = \sin x / \cos x$ the answer should be 8 but using the quotient rule on $\sin x / \cos x$ doesn't seem to get me anywhere, either that or I haven't gone far enough
