XPath, XQuery, and XSLT Function Reference

The XSLT processor's initial focus is the
root of the document, which is
considered the parent of the document
element. Our XPath expression value "
greeting" selects the child named "
greeting" from the current focus, thus

returning the value of the document element named " greeting " from the instance.

Getting started with XSLT and XPath

For BPEL developers and everyone else, you should know that it is used in most all XSL statements. So if you want to work with XSL, you will need to understand how XPath works. XPath navigates down to elements in an XML document similar to the way you change directories in MS-DOS or a Linux shell.

XML, XPath and XSL - Basic and Advanced Features

XSLT References. XSLT Elements. Description of all the XSLT elements from the W3C Recommendation, and information about browser support. XSLT, XPath, and XQuery Functions. XSLT 2.0, XPath 2.0, and XQuery 1.0, share the same functions library. There are over 100 built-in functions.

XSLT Introduction - W3Schools

XSLT is far more sophisticated than CSS. With XSLT you can add/remove elements and attributes to or from the output file. You can also rearrange and sort elements, perform tests and make decisions about which elements to hide and display, and a lot more. XSLT uses XPath to find information in an XML document.

XML and XSLT - W3Schools

XPath is a major element in the XSLT standard. XPath can be used to navigate through elements and attributes in an XML document. XPath stands for XML Path Language XPath uses "path like" syntax to identify and navigate nodes in an XML document

XPath Tutorial - W3Schools

If you know XML, XSLT is easy to master. This course will introduce you to the fundamentals of each component of XSLT: You will learn how to create XSL document and provide transformation

one that utilizes XPath and/or XSLT. Both XSLT and XPath are part of the Extensible Stylesheet Language (XSL) specification...

XML document processing in Java using XPath and XSLT ...

```
<xsl:template match="/Mediendaten">  
<xsl:apply-templates  
select="Mediendaten[@mmid][1]/url"/>  
</xsl:template>
```

The `[@mmid]` constrains the selection to child `Mediendaten` elements that carry the `mmid` attribute, the `[1]` constrains the selection to the first one of these. P.S. Whoever designed the XML you are using hates you.
